

Getting started

Getting ready for AI and GitHub

Save one image, invite your instructor,
and complete initial registration.

Joining after the first class? Use the same steps.

Your setup checklist

- 1 Check your accounts** Open the course page and GitHub.
- 2 Create your repository** Copy the template as Private.
- 3 Save an image and record** Save one image and a short record.
- 4 Invite your instructor** Invite them to your repository.
- 5 Register your repository** Connect your student details and GitHub.

✓ Skip completed steps. Late joiners follow the same checklist.

What you need

A computer

Open a browser.
Have your charger ready.

Your course account

Use it to open
the course page
and submission form.

An AI you can use

Open an AI available
for your course,
or one you usually use.
Send a short question.

✓ A paid plan is optional. You can use the supplied image instead of generating one.

Where to read, save and submit

1. Read the task

Read the instructions in the course materials.

2. Save your work

Put your images and text in your repository.

3. Submit the link

Send the required URL through your course submission form.

Initial registration uses a repository URL. Weekly submissions use a saved commit.

✓ Read the instructor's materials. Save your own work in your own repository.

Your course account

- 1 Open the course page and check the account at the top right.**
Check that the email matches the account specified for this course.
- 2 Switch accounts if you are signed in with the wrong one.**
Use the specified account before requesting access.
- 3 Open the course page again.**
If it still fails, show your instructor the error message.

✓ When you can open the course page and form, continue to GitHub.

Your GitHub account is separate

New to GitHub?

Sign up on the next slide.
Use your university email
and confirm the message.

Already have an account?

Use your current account.
Add and verify your
university email.

✔ Keep your student ID and university email out of your public profile.

Signing up for GitHub

GitHub / Sign up

Email

Your university email

Username

A username you choose

- 1 [Open GitHub Sign up.](#)
- 2 Enter your email, username and password.
- 3 Follow the prompts. Confirm your university email.

Diagram showing the fields to use

✓ Already registered? Use Sign in with your existing account.

Email verification and privacy

- 1 **Open Settings from your profile menu at the top right.**

These are settings for your whole GitHub account.

- 2 **In Emails, add and verify your university email.**

Enter it in Add email address, select Add, then confirm the email.
Skip this if your university email is already your Primary email address.

- 3 **Check Keep my email addresses private.**

Tick the box and check that your university email shows Verified.

- ✓ You can keep your usual primary email address.

Finding your username

Profile

Your profile URL

github.com/example-student

Name to enter in registration

example-student

- 1 Open Profile at the top right.
- 2 The last part of the URL is your username.
- 3 Write down your username. You will use it for registration.

Diagram showing the fields to use

- ✓ Use the name at the end of your profile URL, rather than your display name or email.

Your course's student template

This is the instructor's public template. Sign in, then make your own copy.

The screenshot shows the GitHub interface for the repository 'tsuchiatakahirolab / ai-data-literacy-student-template'. At the top, there are buttons for 'Notifications', 'Fork 0', and 'Star 0'. Below these are tabs for 'Code', 'Issues', 'Pull requests', 'Actions', 'Projects', 'Security and quality', and 'Insights'. The 'Code' tab is selected, showing a file browser with a search bar and a 'Go to file' button. The file browser lists three folders: 'final', 'setup', and 'week01'. To the right of the file browser, there is an 'About' section with the text 'No description, website, or topics provided.' and links for 'Readme', 'Activity', '0 stars', '0 watching', and '0 forks'.

1 Open the student template.

2 Find setup and the other folders.

✓ Copy the template into your own repository before editing it.

Copying with Use this template

Example from GitHub Docs

1 Select Use this template.

Sign in to GitHub first.

2 Select Create a new repository.

This opens the form for your own repository.

✓ Already created ai-learning? Keep it and go to slide 14.

Owner and repository name

Owner * Reposi

Choose an owner ▾ /

- 1 Choose your own account as Owner.
- 2 Enter ai-learning in Repository name.
- 3 Use ai-learning rather than hello or your student ID.

Repository name *

hello

✓ hello is available.

Official example. Use the values shown on the right.

✓ A repository stores your files and their change history.

Creating a Private repository

Create a new repository

Repository name

ai-learning

Visibility

Private

- 1 **Select Private.**
- 2 **Check the Owner and repository name.**
- 3 **Select Create repository.**

Diagram showing the fields to use

⚠ Check that the repository visibility is Private.

Checking your new repository

your-username / ai-learning

Private

Diagram of the page header. Check that the username is yours.

1 Find the setup folder.

You will save your image and short record here.

2 Find week01 and the later folders.

Save each week's work in the corresponding folder.

✓ Check your username, ai-learning and Private before continuing.

Preparing one practice image

Generate an image

Create an image and save it.

Use the supplied image

Save practice.png.

AI and Data Literacy Workshop

Date: 2026-10-15
Time: 13:30-15:00
Place: Room 402, Building 4
Bring: laptop + university account

PDF
Image
CSV
GitHub

Sample image for classroom AI literacy exercises. Fictional material.

Example of the supplied practice image

✓ Either image works. Follow the same upload steps.

Saving the actual image file

1 Open the supplied image page.

Open assets/setup/practice.png.

2 **Select Download raw file to save the image.**

Use the down arrow at the top right. For an AI image, use that AI's download control.

3 **Open the saved file on your computer.**

Look in Downloads or your chosen folder. Check that it is a PNG or JPEG.

⚠ Save the image file itself. Copying the page URL will not save the image.

Opening setup in your ai-learning

The screenshot shows the instructor's template. Work in your own Private copy.

- 1 Open your own ai-learning.
- 2 Find setup/README.md.

✓ Use the top-right menu, Your repositories, then ai-learning to return to your copy.

Uploading an image with Add file

Cropped example from GitHub Docs

1 Select Add file.

Work in your own setup folder.

2 Select Upload files.

This opens the file selection page.

✓ After selecting Upload files, choose the image saved on your computer.

Saving with Commit changes

ai-learning / setup / Upload files

File to upload

One PNG or JPEG image

Commit message

Add a practice image

- 1 Use choose your files to select one image.
- 2 Enter Add a practice image as the commit message.
- 3 Select Commit changes at the bottom to save.

Diagram showing the fields to use

✓ Return to setup. If the image filename appears, it is saved. Open it next.

Checking the image on GitHub

- 1 Select the image filename in setup.**
Open the file you just uploaded.
 - 2 Compare it with the image on your computer.**
Check that the same image appears.
 - 3 If it fails to display, check the original file.**
Check that the image opens locally before uploading it again.
-  Once the image displays, add a short record in the same setup folder.

Your setup README

The README stores your short record. The screenshot is a Japanese template example.

保存した画像のファイル名

(ここにファイル名を書いてください。)

使ったAIまたは配布画像

(使ったAIの名前、または「教員の配布画像を使用」と書いてください。)

自分で確認したこと

(GitHubでファイルを開くなど、実際に確かめたことを書いてください。)

- 1 Return to your own setup.
- 2 Open README.md.

✓ Use the README inside setup, rather than the one at the repository root.

Editing with the pencil button

Cropped example from GitHub Docs

1 Select the pencil button.

This opens README.md for editing.

2 Replace the instructions with your own record.

Keep the headings.
Fill in the next slide's fields.

✓ Keep full AI conversations, your name and student ID out of this record.

Recording what you actually did

Saved image filename

practice.png

AI or supplied image used

Used the instructor's supplied image

What I checked myself

I opened the image on GitHub and confirmed that it matched the file on my computer.

✓ Keep the three headings. Replace the examples with your actual filename, use and checks.

Checking the Preview

Cropped example from GitHub Docs

1 Select Preview.

Check how your record displays.

2 Read all three fields.

Check the filename.
Remove any remaining instruction text.

✓ Preview does not save changes. Confirm the save on the next slide.

Saving your setup record

Commit changes

Commit message

Add an initial setup record

Save to

Commit directly to the main branch

- 1 **Select Commit changes to start saving.**
- 2 **Write a commit message. Choose to save to main.**
- 3 **Select Commit changes again to confirm the save.**

Diagram showing the fields to use

- ✓ Return to the README. Check that your own record appears under all three headings.

Your repository's Settings

Cropped example from GitHub Docs

1 Open your own ai-learning.

Check the Owner and Private visibility.

2 Select Settings.

Use Settings above the repository file list.

✓ If Settings is hidden, check the three-dot menu at the right.

Inviting your instructor's account

ai-learning / Settings

Access management

Collaborators → Add people

Username to invite (ask your instructor)

tsuchiatakahirolab

For another course, replace this example with that instructor's username.

Diagram showing the fields to use

- ✓ Continue once the invitation is pending or the instructor is listed. Keep login codes private.

- 1 In Collaborators, select Add people.
- 2 Select the result with the exact username.
- 3 Select Add ... to ai-learning to send the invitation.

Copying your repository URL

```
https://github.com/example-student/ai-learning
```

Check that example-student is replaced with your own username.

1 Open the root of your own ai-learning.

Select ai-learning at the top to return to the Code file list.

2 Copy the URL from your browser's address bar.

On Windows, use Ctrl+L, then Ctrl+C. Paste with Ctrl+V in the form.

✓ Use the URL ending in /ai-learning for initial registration. Omit /tree/, /blob/ and /commit/.

Your university's student ID format

✓ Example format

2026GT0001

This example has 10 ASCII characters.
Use the full student ID format
required by your university.

Errors in this example format

26GT0001

Year shortened

2026gt0001

Lowercase letters

２０２６ＧＴ０００１

Full-width characters

✓ Enter your student ID in the course form. Keep it out of your public GitHub profile.

Connecting your details and GitHub

- 1 Open initial registration from your course page.**
Check the signed-in account and the email shown in the form.
- 2 Enter your student ID, username and repository URL.**
Complete any other required fields as the form instructs.
- 3 Submit and check the confirmation screen.**
The confirmation screen shows it was received. Keep your repository URL for later.

✓ Initial registration uses your repository URL. Full AI conversations are unnecessary.

Your setup and the instructor's check

Your part

Save your image and record.
Invite your instructor.
Submit initial registration.

The instructor's check

The instructor checks your
registration and repository.
Follow the course page
to find your results.

✔ Wait for the check. You do not need to resubmit just because the results have not arrived.

Your setup is complete when...

- ✓ Your ai-learning repository is Private.
 - ✓ An image in setup opens on GitHub.
 - ✓ Your own short record is saved in setup/README.md.
 - ✓ You have sent an invitation to your instructor's account.
 - ✓ You have submitted initial registration and seen the confirmation.
- ✓ Check the results later. If asked to revise something, update that part.

Your weekly submission

1 Save that week's work and short AI-use record in your repository.

Read the course handout. Write your answers in your own week01/README.md.

2 In Code, open commits, then select the latest commit message.

Return to your ai-learning and open the history above the file list.

3 Copy the commit URL into that week's submission form.

Check for /commit/ and a long string of letters and numbers in the URL.

✓ Before submitting, use Browse files to check that the commit contains all required files.

Joining or continuing later

Starting now

Follow the setup steps.
Use the same initial
registration form.

Continuing

Keep your ai-learning.
Continue from your
first unfinished step.
No need to recreate it.

Making corrections

Update your image or record.
Correct registration too
if your username or
repository URL was wrong.

✓ Image or record edits need no new registration. Ask your instructor about past deadlines.

When you get stuck

Cannot sign in

Course: specified account.
GitHub: separate account.
Check slides 5 to 8.

Cannot edit

Check that you are
in your own repository.
Make your edits there,
not in the template.

Cannot save

Tell your instructor
the error message
and this guide's
slide number.

 Hide passwords, login codes and personal details before sharing your screen.

Student benefits and bookmarks

Student benefits

Check GitHub Education for current benefits.
You can join class while your application is pending.

Easy access to materials

Bookmark the course in your browser for easy access next time.
GitHub Stars are optional.

✔ Student benefits, Stars and paid plans are optional. They do not determine setup completion.

An optional two-line learning goal

ai-learning / README.md

What I want to try in this course

I want to use AI to read documents.
I want to learn how to check its answers.

- 1 Open the README.md at the repository root.
- 2 Select the pencil button. Write two lines about your learning goal.
- 3 Commit your changes. Registration need not be resent.

✓ This is optional. Finish the image, record, invitation and registration first.

Week 01

What can you ask AI to do?

Week 1: Try explanations, rewriting and organizing tasks.

What you will take away

Three uses of AI

Try three tasks with the same AI.

Your own check

Record one thing you verified yourself.

Your first submission

Save a short record on GitHub.

AI capabilities

Talk and explain

Read documents

**Research
information**

**Work with
numbers**

Create images

Plan a task

One AI may offer several capabilities. Availability depends on your account and environment.

Services and capabilities

Choose a service

Open an AI you can use,
such as Gemini or ChatGPT.
One service is enough.

Choose a useful capability

Ask for an explanation.
Rewrite the same text.
Organize steps or constraints.

Preparing for the exercise

01 Open your AI.

Use an AI available for your course or one you already use.

02 Start a new conversation.

Keep names, student IDs and friends' personal details out of the prompt.

03 Open the handout.

Copy the prompts from `en/handouts/week01.md`.

1. Asking for an explanation

Try this prompt

I am a first-year university student.
Explain what a mean is using an everyday example
in about 150 characters.

✔ Check whether you can explain the example in your own words.

2. Rewriting the same explanation

 Try this prompt

Rewrite that explanation for a primary-school student.
Keep the meaning of the numbers unchanged.

 Compare what changed and what stayed the same.

3. Planning the time

Try this prompt

I have 30 minutes for an assignment.
Divide the time between reading the material,
organizing the main points and checking my work.
The total must be 30 minutes.

✓ Add the times yourself and check that they total 30 minutes.

A record of what you checked

Too little detail

It was easy to understand.
It was useful.

Describe your actual check

I added the suggested times.
 $10 + 15 + 5 = 30$ minutes.
No change was needed.

Checking after AI answers

- ✔ Can you explain the idea yourself?
Does the plan meet the constraints?

Today, check at least one part
of the result yourself.

Working with available capabilities

No voice input

Send the same request as text.

No attachments

Use a short text conversation for the task.

Usage limit reached

Check the result you have.
Record the limitation in your notes.

Your work and your checks

week01/

README.md:

Three AI uses you tried

Your README record

What I delegated to AI

What I checked myself

What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 01.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I described the results of three AI capabilities.
- ✓ I recorded what I checked and what I found.
- ✓ I kept personal details out of the prompts and saved work.
- ✓ I submitted the commit URL containing my work.

How should you ask for the same task?

Week 2: Add the necessary conditions and compare the responses.

Comparing two requests

01 Send a short request.

Look at the details AI adds on its own.

02 Add conditions and ask again.

State the audience, source material and required output.

03 Compare the results.

Record which conditions are met and what is still missing.

An event notice for participants

Fictional event for this exercise

Date: October 15, 2026, 13:30-15:00

Place: Room 402, Building 4 Capacity: 40

Fee: Free Registration deadline: October 10

Bring: Laptop and university account

Source: [en/assets/week04/sample_event_notice.md](#) (fictional)

1. A short request

 **Try this prompt**

Write a notice for a university AI workshop.

 Check whether AI invented the date, location or fee.

Details AI may not know

Missing from the request

Who should read it?
When and where is it?
What should they bring?

Material to add

The audience is new students.
Use the supplied information.
Aim for about 180 characters.

2. A source and clear conditions

Try this prompt

Use the supplied material to write a notice for new students in about 180 characters. Include the date, venue, items to bring and deadline. Add no information absent from the source.

 Paste the supplied source text after this request.

Conditions that matter for this task

Purpose

Who is the text for?
What should it
communicate?

Source

Which material
should AI use?
Which facts must
stay fixed?

Output

Length, required
details
and completion
criteria.

Choose the conditions your task needs. A long fixed prompt template is unnecessary.

Comparing the same items

Item to check	Short request	With conditions
Correct date and venue?	Fill in yourself	Fill in yourself
Items to bring included?	Fill in yourself	Fill in yourself
Any invented information?	Fill in yourself	Fill in yourself

Record what worked as well. There is no need to manufacture a bad result.

A focused correction

Try this prompt

Keep the date and venue unchanged.
Add university account to the items to bring.
Keep all other information unchanged.

- ✓ If the first result meets the conditions, additional attempts are unnecessary.

Useful material in your request

Hard to evaluate

Write a perfect notice.
Make it professional and
brilliant.

A request you can check

For new students, 180
characters.
Include date, venue and items.
Use only the source
information.

Choosing a result

- ✓ The date matches the supplied source.
- ✓ All required details are present.
- ✓ The intended students can understand the wording.
- ✓ I can explain my choice in one or two sentences.

Your work and your checks

week02/

README.md:

Two requests, comparison and choice

Your README record

What I delegated to AI

What I checked myself

What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 02.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I showed both requests and the differences in their results.
- ✓ I recorded which details I checked against the source.
- ✓ I avoided unnecessary repeat attempts.
- ✓ I submitted the commit URL containing my work.

Can you explain what you changed?

Week 3: Edit, compare and commit.
Check the version you submit.

Connecting three operations

Edit

Add a short text
and revise it.

Compare

Compare the text
before and after.

Identify the version

Submit its
commit URL.

Git and GitHub

Git

Records file change history.
A commit saves a version.

GitHub

Hosts files managed with Git.
You can also edit them
in a browser.

One file, different versions

First version

Ask AI for an explanation

Revised version

Add information checked against a source

Submitted version

Read it again and choose the version to submit

A change history alone does not prove accuracy or who did the work.

Your own week03 folder

ai-learning / week03 / README.md

Check your own account name

week03 → README.md

Pencil edit button

Diagram of the controls to use

- 1 Open your own repository for your work.
- 2 Open week03.
- 3 Edit README.md.

Writing a short learning record

Enter this in the README

```
## What I delegated to AI  
I asked AI to explain a term.  
I followed up on the part I did not understand.
```

✓ This is an editing example. Replace it with what you actually did.

Your first commit

Commit changes

Message: Add a learning record

Check your changes

Commit changes

Diagram of the controls to use

- 1 Check the display in Preview.
- 2 Write a short commit message.
- 3 Select Commit changes to save.

Adding your own check

 Enter this in the README

I checked the term in the course material.
Its meaning matched AI's explanation.

Write what you actually checked yourself.

✓ Keep the first text and add a record of your check.

Checking added lines in the diff

Existing text

I asked AI to explain a term.
I followed up on the unclear part.

+ I checked its meaning in the course material.
It matched AI's explanation.

Read the text and the + markers. Color alone is insufficient.

Opening the second commit

GitHub / Commits

Add what I checked

Changed file: README.md

Check the added lines

Diagram of the controls to use

- 1 Commit the new changes again.
- 2 Open the history and select the commit.
- 3 Check the lines you added.

The commit URL identifies your version

Repository URL

`github.com/your-username/ai-learning`

Opens the whole repository.
It does not fix a submitted version.

Submitted version URL

`github.com/your-username/ai-learning/commit/commit-hash`

Identifies this commit's version.

These are examples. Copy the displayed URL rather than typing a commit hash.

All the files in your submitted version

01 Open the commit you will submit.

This page mainly shows the files changed in that commit.

02 Open that version using Browse files.

You can inspect all files as they were at that commit.

03 Open week03 and its README.

Check that this version contains every required file.

A file may be in this version even when it does not appear in the latest diff.

Adding a practice file

ai-learning / week03 / Upload files

Add file → Upload files

Select practice.txt

Write a message and commit

Diagram of the controls to use

- 1 Save the supplied practice.txt on your computer.
- 2 In week03, open Upload files.
- 3 Choose the file and commit the change.

After uploading, check the file list to confirm that the file is in week03.

Linking a file from your README

 Enter this in the README

```
[Open the practice file](practice.txt)
```

✔ Check the link in Preview. After committing, open the file using the link.

Images and PDFs work the same way. Match the filename and folder.

Saving and submitting in a browser

Edit in the browser

Edit, then commit.

Changes save on GitHub.
A separate push is unnecessary.

Submit

Use the latest commit URL.

Choose the assignment's week
and submit the course form.

Saving files and a record in the browser

01 Open your own ai-learning.

Read the instructor's course handouts.

02 Open your own week03 folder.

Keep the README headings when you edit.

03 Add required files using Upload files.

Check Preview and save with Commit changes.

Initial setup uses setup. This week's assignment belongs in your own week03.

Submitting your latest commit

01 Open your own week03 folder.

Check that your README and work are saved.

02 Open the latest commit.

Check that its version contains the required files.

03 Copy the displayed commit URL.

Submit the weekly form with the course's specified account.

Initial registration: repository URL. Weekly submission: latest commit URL.

Common problems

Wrong repository

Check your own username and ai-learning.

File not visible

Check your repository after the commit has saved.

Instructor cannot open it

Check the pending invitation and URL, then await the check.

Your work and your checks

week03/

README.md:
Changes and verification results

Your README record

What I delegated to AI
What I checked myself
What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 03.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I can explain the difference before and after editing.
- ✓ I opened the files at the commit I submitted.
- ✓ I used my own Private repository.
- ✓ I submitted the commit URL containing my work.

Where is the answer in the source?

Week 4: Read an event notice and separate
source facts from assumptions.

Answers from one source document

01 Give AI the supplied document.

Use the PDF, image or source text.

02 Organize what participants need to know.

Ask for the date, venue and items to bring.

03 Check the original document.

Mark information absent from the source as unknown.

A fictional workshop notice

AI and Data Literacy Workshop

October 15, 2026 13:30-15:00

Room 402, Building 4 / 40 places / Free

Registration deadline: October 10, 2026

Bring: Laptop and university account

The dates are for this exercise. This is a fictional event.

Giving AI a file

01 Save the supplied file to your computer.

Use `sample_event_notice.pdf`.

02 Choose it with the AI's attachment control.

Wait for the upload to finish.

03 Check that the document name appears.

If attachments are unavailable, paste the corresponding `.md` text.

This is a short source. Pasting its text lets you do the same exercise.

1. Information for participants

Try this prompt

Using only this document, make a table of the date, venue and items to bring. For missing information, write Not stated.

- ✓ Check the date, time and room number against the original, one item at a time.

Checking against the original

Item	Source content	Your own check
Time	13:30~15:00	Match / mismatch
Venue	Room 402, Building 4	Match / mismatch
Bring	Laptop, university account	Match / mismatch

Use this table for checking. Compare AI's actual output before marking a match.

2. Asking about missing information

Try this prompt

Are there power sockets at this venue?
Answer only what the document supports.

✓ No information about sockets does not mean there are no sockets.

Keeping unknowns clear

Supported by the source

The notice does not state whether power sockets are available.

Unsupported by the source

There are no sockets.

Or:
Every seat has a socket.

Checking answers about an image

Was any text misread?

Do table headings match their values?

If AI cannot read a part, enlarge
the original image and check it yourself.

A correction grounded in the source

 [Try this prompt](#)

The venue is Room 402.
Check the venue field in the source and correct the table.
Check whether the other entries match the source too.

✔ Use this request if there is an error. A correct result needs no correction.

Finishing this week's task

- ✓ I made a table of the date, venue and items to bring.
- ✓ I checked every item against the original.
- ✓ I identified one detail absent from the source.
- ✓ I separated AI's assumptions from source facts.

Your work and your checks

week04/

README.md:

Check table and missing information

Your README record

What I delegated to AI

What I checked myself

What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 04.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I recorded where I checked in the source.
- ✓ I verified the date, time and room number.
- ✓ I avoided unsupported claims about missing information.
- ✓ I submitted the commit URL containing my work.

Does clearer wording change the meaning?

Week 5: Compare rewriting and translation.
Check which conditions must stay.

One text, different readers

01 Read the original text.

Identify claims and conditions that must stay unchanged.

02 Create two versions.

Write for new students, then translate into a language you can check.

03 Compare with the original meaning.

Check omissions, overstatements and changes in obligations.

Three ideas in the source

Generative AI can help organize information, write text and understand documents.

Its output may contain errors or weak support.
In this course, record the AI and purpose of use.
Check the final content yourself.

Display summary of `en/assets/week05/rewrite_source.md`. Use the supplied full source for the task.

What needs to remain

Uses

Organize information.
Help with writing
and understanding
text.

Limitations

Output may contain
errors
or lack supporting
evidence.

Required actions

Record your AI use.
Check the content
yourself.

1. Rewriting for new students

Try this prompt

Rewrite this text in plain English
for new university students.
Keep the uses of AI, the possibility of errors,
and the need to record use and check the result.

✓ Paste the full `rewrite_source.md` text after the request.

Keeping required actions required

Meaning preserved

Record the AI you used and its purpose. Check the content before submitting.

Meaning changed

Check only the parts that concern you.
Keeping a record is optional.

2. Translating for another audience

Try this prompt

Translate the same source into plain language in another language I can verify.
Keep recording and checking as requirements.
Do not make them optional.

- ✓ Check all three source ideas. Use a target language you can verify, or record the limitation.

The strength of an obligation

Matches the source

Record the AI tool used.
Check the final content
before submitting it.

Weaker meaning

You may keep a record
if you find it useful.

A requirement became optional.

Teaching examples for comparison. These are not recorded outputs from a particular AI.

Checking a translation

01 Review the three source ideas.

Uses, possible errors, and the requirement to record and check.

02 Find each idea in the translation.

Check unfamiliar words with a dictionary or course material.

03 Record anything you could not verify.

An AI back-translation alone cannot establish accuracy.

A three-row comparison record

Source idea	Rewritten version	Check result
Uses of AI	Find the matching passage	Kept / changed
Possible errors	Find the matching passage	Kept / changed
Record and check required	Find the matching passage	Kept / changed

Your work and your checks

week05/

README.md:
Rewrite, translation and meaning checks

Your README record

What I delegated to AI
What I checked myself
What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 05.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I made two versions from the same source.
- ✓ I kept recording and checking as requirements.
- ✓ I recorded any translation details I could not verify.
- ✓ I submitted the commit URL containing my work.

A notice readers can act on

Week 6: Use an AI draft to create
a guide to AI use in this course.

Your reader: a new student

They have asked questions in an AI chat.
They have not checked sources
or saved a record on GitHub.

Explain the first action they should take.

Three things your notice needs

AI use is allowed

Ask for explanations.
Organize information.
Draft a text.

Check the result

Check AI's output
before submitting
it.

Keep a short record

Save what you
delegated
and checked on
GitHub.

1. Asking for a draft

Try this prompt

Write a 300-500 character notice for new students about AI use in this course. Include that AI is allowed, that students must check the result, and that they keep a short AI-use record on GitHub.

- ✓ Paste the supplied brief below. Ask AI to use only supplied course URLs and facts.

Writing actions a reader can follow

Abstract instructions

Use AI effectively.
Verify it appropriately.
Create high-quality work.

A concrete action

If AI's answer has a number,
find it in the original source.
Record where you checked it.

2. Editing the draft yourself

01 Break up long explanations.

Order the text by the actions your reader takes first.

02 Replace vague verbs with specific actions.

For example, replace verify with compare the numbers in the source.

03 Read it from your reader's perspective.

Will they know what to open and what to check?

A one-page guide

Use one heading.

Put the required actions in order.

Shorten the text if the letters get too small.

Use your usual document or slide software.

A text-only submission is fine. A separate design-tool account is unnecessary.

An optional illustration with a purpose

Try this prompt

Create an illustration for this notice.
Show someone opening a document to check it.
Use no real students or university logos.
Leave space for the notice text.

✔ Image generation is optional. Text and simple shapes are enough.

Checking an illustration

01 Check that it supports the notice's meaning.

Does it help readers understand the required action?

02 Check any text and small details.

Look for spelling errors, unwanted logos and misleading details.

03 Request a correction only where needed.

Add a description so the meaning is available to people who cannot see it.

A 30-second reader check

- ✓ Did the reader understand the purpose of the notice?
- ✓ Did they understand the first action to take?
- ✓ Did they understand what to record?
- ✓ Did they identify one unfamiliar word?

If no other reader is available, take a break and read it again yourself.

Your work and your checks

week06/

README.md:

Purpose and verification record

Notice text or a one-page guide

Your README record

What I delegated to AI

What I checked myself

What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 06.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I created a 300-500 character notice or a one-page guide.
- ✓ I described concrete actions the reader can take.
- ✓ I checked how well it communicates, with or without an image.
- ✓ I submitted the commit URL containing my work.

Does the source support the answer?

Week 7: Check information AI gives you on the original page.

Where did the information come from?

Model training

Material you supplied

Web search

Connected data

The same chat interface can use different sources of information.

Checking two pieces of information

01 Choose the questions to check.

Choose specific information that could change over time.

02 Use AI to help find sources.

Search the web yourself if needed.

03 Open the original pages and compare.

Record the publisher, date and supporting passage.

Practice topic: GitHub registration

Question 1: How do you verify a registered email address?

Question 2: Can you add another email to an existing account?

Product details change. Record the official page and the date you checked it.

1. Asking AI to find information

Try this prompt

Use official GitHub documentation to find how to verify an email and add another email. For each item, show the page that supports your answer.

- ✔ Without AI web search, find official pages yourself and give AI the relevant text.

2. Opening the sources

01 **Actually open the links in the answer.**

A page title alone is not a completed check.

02 **Check who published the page.**

Distinguish official GitHub Docs from someone's personal explanation.

03 **Find the passage supporting the answer.**

Use page search and read the surrounding explanation.

A URL and supporting evidence

Still unchecked

It included a link.
It named an official site.
AI said it was correct.

An actual check

I read the relevant paragraph.
The email addition steps
matched AI's explanation.

Four items in your source record

Item	What to record
Information checked	What you investigated
Source and publisher	Page URL and publishing organization
Date	Date checked and update date, if known
Comparison result	Match, mismatch or unable to verify

When a source cannot be read

A broken link, restricted access or mismatched content.

Find another official source, or record that this source did not let you verify the claim. Keep unverified URLs out of your evidence.

3. Correcting a mismatch with evidence

Try this prompt

This passage in the official documentation does not match your earlier explanation. Correct that part and separate what the source confirms from what remains unknown.

✓ Paste only the relevant source passage after this request.

Conclusions for both questions

- ✓ I actually opened at least two source pages.
- ✓ I connected each claim to the passage supporting it.
- ✓ I recorded the date I checked.
- ✓ I reported mismatches and anything still unverified.

Your work and your checks

week07/

README.md:

Questions, answers and source checks

Your README record

What I delegated to AI

What I checked myself

What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 07.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I checked two pieces of information on the original pages.
- ✓ I recorded check results as well as URLs.
- ✓ If search was unavailable, I recorded my alternative method.
- ✓ I submitted the commit URL containing my work.

Does the evidence really support that?

Week 8: Revise assertions, generalizations
and stereotypes to fit the evidence.

Questioning a sample text

University students always get higher grades with AI. AI is more accurate than humans and can give the best answer to every assignment.

Students who do not use AI are behind the times and have poor data literacy.

Fictional text with deliberate problems for this exercise. It is not a recorded AI response.

Three ways to examine a claim

Evidence

Is there support
for the word
always?

Scope

Does a result for one
task
justify a claim about
every assignment?

Stereotypes

Does the text
ignore
reasons for not
using AI?

1. Your own first check

01 Read the supplied text.

Choose three phrases that concern you.

02 Explain why each concerns you.

Consider weak evidence, generalization and stereotyping.

03 Give AI the text and your reasons.

Compare AI's observations with your own.

2. Asking AI to examine the text

Try this prompt

Identify unsupported assertions,
overly broad generalizations and stereotypes
about students in this text.
Show the original phrases that cause the problem.

- ✔ Look for the exact phrase and reason, rather than a general verdict that the text is wrong.

More than removing always

Only weaker wording

Using generative AI
probably might improve
your grades.

Relevant conditions

AI can help explain and
practice.
Its impact on grades depends
on the task and how it is used.

This is an illustrative rewrite for the exercise, rather than an empirical finding.

Reasons for not using AI

A stereotype

Students who do not use AI have low ability.

Conditions to consider

Different devices or accounts.
Different course rules.
Concern about sharing information.

Not using AI alone does not establish a student's ability or motivation.

Matching problems and revisions

Original phrase	Problem	Revision approach
Always improves grades	Unsupported assertion	Separate conditions and evidence
Every assignment	Overgeneralization	Limit the scope
Behind the times	Stereotyping students	Remove; consider other reasons

3. Revising to fit the evidence

Try this prompt

Revise the phrases you identified.
Separate what is known from what needs evidence.
Add no invented studies or statistics.

✓ Check that the revision introduces no new unsupported assertions.

Keeping parts that need no change

- ✔ Each identified phrase has a corresponding reason.
- ✔ Relevant conditions are stated.
- ✔ I assessed AI's suggestions before accepting them.
- ✔ I added no unsupported statistics or study names.

Your work and your checks

week08/

README.md:

Three problems and a revised text

Your README record

What I delegated to AI

What I checked myself

What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 08.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I identified the exact problems in the original.
- ✓ I explained my reasons for revising them.
- ✓ I treated the text as a teaching example, not a recorded AI response.
- ✓ I submitted the commit URL containing my work.

What percentage of which people?

Week 9: Calculate percentages yourself
and check AI's numbers and explanations.

Fictional data for four groups

Group	Students	Submitted	AI users	Source checkers
A	32	28	25	18
B	30	24	20	13
C	35	31	29	17
D	29	20	18	9

Fictional teaching data from numbers_exercise.csv. These are not real student records.

1. Asking AI to calculate submission rates

 Try this prompt

Using this table, calculate each group's submission rate and the overall submission rate.
Use submitted / students x 100.
Show the numerator, denominator and formula.

✓ If you cannot attach the CSV, paste the four-row table.

Group A: a calculator check

28 submitted / 32 students

$$28 \div 32 \times 100 = 87.5\%$$

Compare AI's formula and answer with your calculator.
A matching result is also a check worth recording.

The same 18 people, different denominators

All students as denominator

18 source checkers / 32 students

56.25%

AI users as denominator?

The table does not show whether all 18 also used AI. It does not justify using 18 / 25.

This aggregate table does not tell us which categories overlap for each person.

Overall rate: add the counts first

Submitted: $28 + 24 + 31 + 20 = 103$ people

$$103 \div 126 \times 100 \approx 81.7\%$$

Students: $32 + 30 + 35 + 29 = 126$ people

Calculate from totals rather than averaging the group percentages.

Results by group

Group	Numerator / denominator	Submission rate
A	28 / 32	87.5%
B	24 / 30	80.0%
C	31 / 35	88.6%
D	20 / 29	69.0%

Round to one decimal place. Recalculating from rounded values can introduce rounding error.

Percentage points and relative increase

Difference in percentages

From 60% to 75%.

$75 - 60 = 15$ percentage points.

Relative increase

The same change: 60% to 75%.

$(75 - 60) / 60 = 25\%$ increase.

State what changed and which starting value you used.

2. Checking calculations and explanations

01 Use a calculator for one group.

Check the numerator and denominator against the table.

02 Calculate the overall rate from the totals.

Add the counts before dividing.

03 Read AI's explanation.

Make clear which people and which proportion the result describes.

3. Explaining what a number means

 Try this prompt

The overall submission rate was about 81.7%.
Explain it in one sentence that identifies
the numerator and denominator.
Avoid speculation about causes.

✓ The table alone cannot explain the submission rate or establish AI's effect.

The scope of your explanation

- ✓ I distinguished counts from percentages.
- ✓ I stated the denominator.
- ✓ I used consistent rounding.
- ✓ I avoided inferring a cause from these numbers alone.

Your work and your checks

week09/

README.md:
Calculations, formulas and one-sentence
explanation

Your README record

What I delegated to AI
What I checked myself
What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 09.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I calculated one group and the overall rate myself.
- ✓ I stated the denominator explicitly.
- ✓ I identified the data as fictional teaching data.
- ✓ I submitted the commit URL containing my work.

A large increase? Check the axis first.

Week 10: Compare displays of the same values and state what the data supports.

Two displays of the same data

Vertical axis starts at 0

Vertical axis starts at 3.0

Fictional teaching data. Only the axis range differs; the values are identical.

The original values

Year	reported_confidence
2022	3.1
2023	3.2
2024	3.3
2025	3.4
2026	3.5

chart_claim_data.csv. The meaning of the scale and measurement method require more information.

Reading a chart in order

What is measured?

Read the label, unit and time period.

How is it displayed?

Check axis endpoints and tick marks.

What are the values?

Calculate the difference and compare your impression.

1. Asking AI to explain the charts

 Try this prompt

Compare these two charts.
Check their values and vertical axis ranges.
Explain why their visual impressions differ.

✓ If image upload is unavailable, describe the data and axis ranges in text.

The increase is 0.4

From 3.1 in 2022 to 3.5 in 2026

$$3.5 - 3.1 = 0.4$$

Show the actual difference before describing a sharp rise.
Also check the scale and survey method.

Changing an axis can be appropriate

Starting at zero

Shows the size relative to zero.
Check carefully when comparing
the lengths of bars.

Showing a narrower range

Makes small changes easier to
see.
Differences also look larger.
State the axis range clearly.

What the chart leaves out

Q How many people were surveyed, and how?
Were measurement conditions the same each year?

If the chart does not show this information,
record that it cannot establish these details.

2. An explanation without exaggeration

Try this prompt

Explain this fictional data in two sentences.
In the first, state the numerical change.
In the second, state what this source cannot establish.
Avoid speculation about the cause.

✓ Check the values, period and axis ranges yourself.

The visual impression and the data

An unsupported explanation

It surged in 2026.
The spread of AI probably caused the increase.

Supported by this source

From 2022 to 2026,
the value rose from 3.1 to 3.5.
The reason is not established.

Your chart-checking record

- ✔ I confirmed both charts use the same five values.
- ✔ I explained the different vertical axes.
- ✔ I stated the actual difference of 0.4.
- ✔ I recorded missing information about the scale or survey.

Your work and your checks

week10/

README.md:
Axis comparison and two-sentence
explanation

Your README record

What I delegated to AI
What I checked myself
What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 10.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I compared the chart with the source data.
- ✓ I distinguished the impression from the actual difference.
- ✓ I avoided unsupported claims about the cause.
- ✓ I submitted the commit URL containing my work.

What do you check when you receive data?

Week 11: Use 60 fictional data rows
and check tables, summaries and charts.

No coding required today

Give AI the supplied CSV and ask it to calculate summaries.

Check the calculations against the source or with a spreadsheet as well.

AI's output alone is insufficient evidence.

Your analysis sequence

Inspect

Check rows,
columns
and missing values.

Summarize

Show group means
in a table and
chart.

Verify

Check a calculation.
State the limits of
the result.

Fictional data, not student records

This data was created for teaching.

60 rows and 6 columns: group, AI-use time, self-ratings before and after, source checking and submission on time.

Use `en/assets/week11/ai_study_data.csv` and `data_dictionary.md`.

1. Giving AI the CSV

01 Save the CSV linked in the handout.

Open the file and check that it has column headings.

02 Attach it using the AI's file control.

Check that you selected the correct file.

03 If attachments are unavailable, use a spreadsheet.

Summarize it in a spreadsheet, then ask AI to explain your results.

2. Checking rows and columns

Try this prompt

Check this CSV's data row count and column names.
Explain what each column represents.
Check for missing values.
Exclude the header row from the data row count.

✔ Open the data dictionary and compare it with AI's explanation.

Column names and their definitions

Column	Meaning
student_group	Groups A, B and C
confidence_before / after	Self-ratings before and after
source_checked	Source checked: yes / no
submitted_on_time	Submitted on time: yes / no

A self-rating is not a measure of academic ability. Read the definitions in the data dictionary.

3. A summary for each group

Try this prompt

For each student_group, calculate the count and mean of confidence_after.
State the columns used and how you handled missing values.

✓ Check the group counts as well as the means.

Comparing with the reference values

Group	Count	Mean after
A	27	4.00
B	12	3.25
C	21	3.86

Calculated from the supplied 60 fictional rows. Means are rounded to two decimal places.

One check using another method

Rows with source_checked = yes: 42

$$42 \div 60 \times 100 = 70\%$$

Count yes rows with a spreadsheet filter, for example.
Record your method and whether the result matches AI's.

4. A bar chart

Try this prompt

Make a bar chart of mean confidence_after by group.
Use a vertical axis from 0 to 5.
Include the means and group counts.
Label the data as fictional teaching data.

✓ If chart creation is unavailable, submit the summary table instead.

Read counts as well as means

Fictional teaching data. Mean self-ratings after use, by group.

Observed differences and their causes

What the table shows

In the supplied data,
A's mean of 4.00 is higher
than B's mean of 3.25.

What this table cannot establish

AI improved A's
academic ability.
It works for every student.

5. A short explanation of the result

01 Describe the kind of data.

State clearly that this is fictional teaching data.

02 Describe the results you checked.

Give the means, counts and calculation you verified.

03 Describe what remains unknown.

This fictional data cannot test an effect on real students.

Your work and your checks

week11/

README.md:
Results and verification method
Summary table and chart, if
available

Your README record

What I delegated to AI
What I checked myself
What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 11.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I checked the row count, columns and missing values.
- ✓ I verified at least one result using another method.
- ✓ I identified the data as fictional.
- ✓ I submitted the commit URL containing my work.

Explain it yourself to check your understanding

Week 12: Listen, answer for yourself
and find what you do not yet understand.

Different roles for the same AI

Getting only the answer

Paste the question.
Read the answer.
Submit it unchanged.

A practice partner

Ask for an explanation.
Try questions with answers
hidden.
Answer yourself and check your
reasons.

Practicing correlation and causation

01 Ask for an explanation and example.

Understand why correlation and causation differ.

02 Think through three questions yourself.

Keep the correct answers hidden initially.

03 Compare the explanations with course material.

Check both your reasoning and AI's explanation.

1. An everyday explanation

Try this prompt

Explain correlation and causation to a first-year university student using an everyday example. Use a fictional example rather than a real study. State that it illustrates the idea.

✓ After reading, explain the difference in one sentence yourself.

Another explanation for a fictional example

On hot days, ice cream sales are high.
Swimming pools also have more visitors.

Did selling ice cream cause
more people to visit the pool?

Fictional example for reasoning practice. This is not observed data.

2. Three questions with answers hidden

 **Try this prompt**

Create three short questions that distinguish correlation from causation. Ask them one at a time. Wait for my answer before showing the correct answer or explanation.

✔ If you get stuck, ask for a hint before asking for the answer.

3. Giving reasons for your answer

01 **Decide: correlation or causation?**

If you cannot decide, explain why.

02 **Think of one alternative explanation.**

Could another factor affect both things?

03 **Then read AI's explanation.**

Compare it with your own reasons.

Checking AI's marking too

AI says correct

Is the reasoning correct too?
Did you understand it,
or only guess the option?

AI says incorrect

What difference did it identify?
Does the question support that?
Does it match the course
definition?

4. Asking about an unclear point

Try this prompt

Which part of my explanation is unclear?
Explain just one point using the earlier example.
Then give me one similar practice question.

✓ If you can explain it all, make another example yourself and check it.

A record of reasoning and checking

- ✔ Record how you reasoned and checked, rather than just your score.

If your answers are correct, there is no need to invent errors or retries.

Your work and your checks

week12/

README.md:
Explanation, reasoning and checks

Your README record

What I delegated to AI
What I checked myself
What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 12.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I recorded the reasons I thought through myself.
- ✓ I compared AI's explanation with the course material.
- ✓ I separated what I understood from my remaining questions.
- ✓ I submitted the commit URL containing my work.

Does the plan meet the conditions?

Week 13: Plan in stages and check times, costs and the itinerary.

A planning exercise

Ask AI for a research process and a draft plan.
This exercise includes no bookings, purchases or sending.

Decide what you will check at each stage
before proceeding.

A task with several stages

Plan

List the needed information and order the steps.

Supply material

Give AI the conditions and permitted sources.

Check along the way

Revise any part that fails a condition.

A half-day itinerary for five students

Leave Kyoto Station at 13:00; finish by 17:30.
Travel on foot and by public transport.
Transport budget: JPY 1,500 per person.
Include a quiet place and a break.

Use the supplied fictional facility information.

Travel times, fares and facilities are fictional teaching data. They are not a real travel guide.

1. Asking for the process first

Try this prompt

I want a half-day itinerary under these conditions.
First, list the information needed
and the order in which to check it.
Before completing the itinerary, ask about unclear
conditions.

✔ Supply both the conditions and `offline_itinerary_data.md`.

Conditions in the fictional source

Place	Available times	Stay requirement
Museum A	13:00~17:00	Quiet place / at least 45 min
Park B	13:00~18:00	At least 30 min
Rest area C	14:00~17:00	Break / at least 30 min

Use the source table for each journey's travel time and fare.

2. An itinerary based on the source

Try this prompt

Use only the supplied fictional facilities and travel table. Show departures, arrivals, stays, travel times and fares. Include waiting time and check that we return by 17:30.

✓ Keep invented shortcuts, fares and opening hours out of the plan.

Checking an example yourself

13:00	Leave Kyoto Station
13:30–14:15	Museum A: 45 min
14:35–15:05	Rest area C: 30 min
15:20–15:50	Park B: 30 min
16:20	Return to Kyoto Station

Example based on the fictional travel table. Transport costs JPY 920 per person.

One condition at a time

Condition	Check of the example
Finish by 17:30	Return at 16:20
Transport $\leq$ JPY 1,500/person	JPY 920
Include a quiet place	Museum A for 45 min
Include a break	Rest area C for 30 min

Read and verify the table yourself, even if AI says all conditions are met.

3. Revising a changed condition

Try this prompt

Change the Museum A stay to 60 minutes.
Keep the other conditions.
Update only the affected times.
Check the transport cost and finish time again.

✔ Check for yourself what changed and what stayed the same.

Additional checks for a real outing

The basic class task

Check times and costs within the fictional source. This is a planning exercise.

Extension: a real plan

Choose the travel date.
Check transport and opening times.
A person decides bookings and payments.

Explaining what you delegated

- ✓ I checked the sequence before proceeding.
- ✓ I recalculated times, fares and stay durations.
- ✓ I used only information in the supplied sources.
- ✓ I made no bookings or purchases and sent nothing.

Your work and your checks

week13/

README.md:
Itinerary, condition checks and revised
plan

Your README record

What I delegated to AI
What I checked myself
What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 13.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I kept the original itinerary and the revised one.
- ✓ I verified transport cost per person.
- ✓ I clearly identified the plan as fictional.
- ✓ I submitted the commit URL containing my work.

Your question, evidence and explanation

Week 14: Choose a final-project question
and sources, then make a first draft.

A plan you can submit

01 Write your question in one sentence.

Limit it to what available sources can answer.

02 Choose sources and a checking method.

Decide what information would support an answer.

03 Try a small draft, then revise the plan.

Make an outline and start an evidence record.

Choosing an approach

A: Read a document

Explain the relevant information from one document.

B: Check sources

Open and compare at least two sources.

C: Analyze data

Summarize the supplied CSV and explain the results.

A harder topic or paid capability does not automatically earn a higher mark.

A question you can check

Too broad

How will AI change society?

The sources and scope
can grow without limit.

Manageable for this project

What should a new AI user
prepare for the workshop?
Check the supplied document.

Pairing a source with a check

Project choice	Source to use	Item to check
A: Event notice	Supplied PDF or text	Date and items to bring
B: Registration steps	At least two official pages	Steps and conditions
C: Data summary	Supplied CSV and dictionary	Columns, counts and means

Asking AI to check the scope

 **Try this prompt**

Can the sources I have answer this question?
Separate what these sources establish
from what needs additional sources.
If the question is too broad, narrow it to one question.

- ✓ Give AI the question and sources. A suggestion alone does not add evidence.

The first row of your evidence log

Claim to explain	Source	Your own check
Required items to bring	Workshop notice	Matches the Bring field
Example row only	Use your own source	Record the passage you checked

Record how the claim and evidence connect. Long quotations are unnecessary.

Trying a small part of the plan

01 Draft an opening paragraph or one table.

You do not need the full final version yet.

02 Return to a source and check one detail.

Check whether it supports the answer you need.

03 Revise the plan.

If evidence is insufficient, narrow the question.

Week 14 and final: separate submissions

Week 14: Question, sources, checking method and outline.

Final project: Completed work and evidence log.
Submit it separately through the final-project form.

Your work and your checks

week14/

README.md:

Plan, outline and one evidence row

Your README record

What I delegated to AI

What I checked myself

What I could not verify

Submitting the saved version

01 Commit your changes on GitHub.

Check the updated files and commit them.

02 Open that commit's page.

Check that the URL contains /commit/.

03 Submit the course form.

Use the specified course account and choose Week 14.

A browser commit saves to GitHub. A separate push is unnecessary.

Before you submit

- ✓ I wrote a one-sentence question.
- ✓ I specified sources and a checking method.
- ✓ I chose the format for my final project.
- ✓ I submitted the commit URL containing my work.

Final project

Checked evidence, your own finished work

Final project: Check work made with AI
and explain it to a new reader.

Completing one question

- 🎯 Use sources to answer the question from Week 14.
Record what you delegated to AI and checked yourself.

Marks depend on the connection between the question, evidence and finished work.
An expensive tool is unnecessary.

Three possible approaches

A: Document reading

Explain the document's content for your intended reader.

B: Source checking

Compare sources and report what you verified.

C: Data analysis

Verify the summary.
Explain results and limits.

A format that suits your explanation

An 800-1,200 character explanation, or a one-page guide, table or chart with equivalent content.

Include an explanation of what the figures show and what they cannot establish.

Check your course page for the deadline, language-specific length and submission form.

Three checks before completion

01 Does it answer your question?

Check that it has not drifted to another topic.

02 Are claims and numbers supported?

Can you identify the source passage you checked?

03 Can a new reader understand it?

Check the connection between terms, figures and sources.

Your work and its evidence log

Claim or number	Supporting source	Your own check
Content used in your work	URL or filename	Passage, value or date
A mismatch found	Sources compared	What you corrected
Unverified content	Source still needed	Decision to leave it unasserted

A short AI-use record

Unnecessary to submit

Chat sharing links.
Full conversations.
Proof of a paid plan.

What to record

AI used and purpose.
Tasks delegated to AI.
Your own checks and revisions.

Four assessment criteria

50%

Finished work

Is the answer clear?

25%

Evidence checks and revisions

Was it compared with sources?

15%

AI-use record

Is the delegated work explained?

10%

GitHub submission

Is the required version identified?

Marks do not depend on memorization, service names, paid plans or prompt length.

Saving everything in final

final/

README.md:

Question and AI-use record

Finished work: text, guide, table,
etc.

evidence_log.md: evidence
record

Your README record

The evidence log can also
be in the README.

Link to images and CSVs
so readers can open them.

The final-project submission

01 Commit all files in final.

Browser commits are already saved on GitHub.

02 Open your finished work at that commit.

Check that figures, images and evidence log are present.

03 Submit the final-project form.

Use the specified course account to submit the commit URL.

The Week 14 submission does not replace the final-project submission.

Opening the actual files before submitting

- ✓ The question, answer and evidence log correspond.
- ✓ I checked numbers, dates and names.
- ✓ I included no personal details or private documents.
- ✓ I opened the submitted commit and checked all files.

Explaining your own decisions

- ✓ Which work did you delegate to AI?
What did you check in its output?
What did you keep, and what did you revise?

Make these decisions clear in your finished work.
